

Common Side Effects of Immune Checkpoint Inhibitors

In the past decade, cancer researchers have developed a type of immunotherapy called immune checkpoint inhibitors (ICIs), which are treatments that help the body recognize and attack cancer cells. The success of this treatment has led to many more people living longer, fuller lives. Only now are we seeing the long- and late-term side effects survivors treated with ICIs can develop. Below are some of the more common side effects and the frequency in which they occur.
